My Coptic Church: UX/UI Audit of the Churches Page

Oct 26, 2026 · @M

Scope

The page feels off because of four layout problems, not because of the Coptic colors. This audit covers the Churches page (`#/churches`) of the live site, measured in the browser at desktop width (about 800–1024px) and phone width (375px).

- **Measured:** fonts, font sizes, text contrast, button sizes and CSS color variables, read from the live page.
- **Judged from screenshots:** card layout, logo consistency and visual hierarchy.
- **Not covered:** the other tabs (Today, Events, Feasts & Fasts, Coptic Welcome, About), keyboard focus, and Arabic/RTL mode. These may have their own problems.

What's making it feel off

1. Everything is the same small size, so nothing leads.

- 1,600 of the ~1,650 text elements use one font family (Source Sans 3), and almost all of it is between 11px and 13.5px.
- The page uses 15 font sizes, including near-duplicates like 11.1, 11.25, 11.4, 11.7, 12.3, 12.6, 12.75 and 12.9px. Differences under half a pixel read as mistakes, not hierarchy.
- The church name (17px serif) is the only large element. The next service ("Friday · 8 PM · Youth Service"), which is what a visitor most wants, is 13px in a grey box.
- Fix: use a fixed scale such as 12 / 14 / 16 / 20 / 28px and nothing in between. Make the next service the second-biggest thing on the card.

2. The church logos clash with each other.

- Each card shows whatever logo the church uses: navy with wide-spaced text, gold on a blue badge, bilingual black text, a cartoon St. Mark.
- Your palette is calm and cream, so these logos fight it. This is probably the strongest "something's off" signal in the screenshots.

- Fix: put every logo in the same fixed-size neutral box, and consider a muted or monochrome version. You can't control other churches' branding, so contain it.

3. The cards form a ragged grid.

- The three-column layout has uneven card heights (one card measured 417px), leaving jagged gaps. A card with an extra "Live" button on a second row is taller than its neighbours.
- Fix: make the cards equal height and keep the buttons in one row or in the same position on every card.

4. Maroon is used on too many things, so it stops meaning "act".

- It appears as the top border of all 425 cards, the Call button, every "Report a problem" link and the active tab.
- "Report a problem" is a rare action but has the same color as the main action, with a flag icon on every card.
- Fix: keep maroon for Call only. Make "Report a problem" a muted grey text link, or move it under "More Info".

Other findings

- **Unstyled email links.** Contact emails render in default browser blue (`rgb(0,0,238)`), which matches nothing else. Your page also uses a second blue (`#1f4e8c`) for "Is this your church?", so there are two different blues. Style both in one link color.
- **Misnamed color variable.** Your CSS calls maroon `--lapis` (`#7a1f2b`), but lapis is a blue. Rename it `--maroon` so it doesn't mislead you when you edit. Two other variables (`--ty-bible` and `--day5`) use the keyword `sienna` instead of a hex code, which breaks your own pattern.
- **Blank map on first load.** The map showed a plain grey rectangle for a few seconds before the tiles appeared. At 800×600 it also takes about half the screen, so the first view is mostly map and no churches. Add a loading placeholder and make the map shorter on desktop.
- **Uneven data quality shows.** Cards range from full (logo, next service, parking) to bare. Some say "Street address not found yet" in italic gold, and many have no Call button. Hide missing fields or group those cards separately.
- **Missing alt text.** 4 images (the logos) have no alt text. Use the church name.

What's working

- **Contrast is good.** I found no failures. The main text color (`#2b1f1a`) on cream is around 15:1, and the muted text is above 4.5:1.
- **The colors are not the problem.** Maroon, gold and cream is a legitimate Coptic palette and doesn't need to change. The problem is how the colors are distributed.
- **The phone layout is cleaner than desktop.** One column, 45px tabs, no horizontal scroll.
- **Buttons are 36px tall,** which passes WCAG 2.5.8 (24px minimum). Apple recommends 44px for touch and most controls fall short of that, so treat it as polish, not a failure.

Fix order

1. Set a fixed type scale and make the next-service line bigger. This is probably the biggest single improvement.
2. Contain the logos in one neutral, fixed-size box.
3. Make the cards equal height.
4. Restrict maroon to Call, and mute "Report a problem".
5. Style the email links and rename the color variables.

Nothing on the site has been changed yet.
